

Assignment 1: Insights

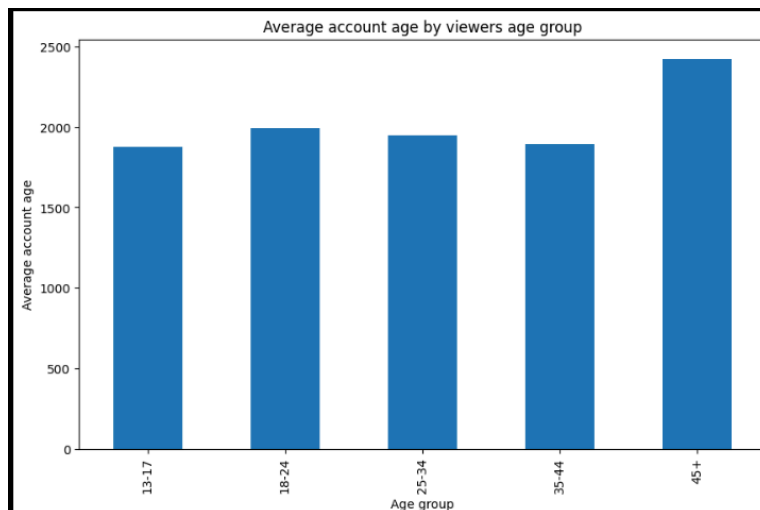

By: Atif M. Mahmud

Features of streamer affecting checkins

Our goal here was to observe which factors are most closely related to the number of check-ins a streamer receives. We expected there to be a positive correlation of total followers and average concurrent viewers with total checkins, The strongest correlation was between average concurrent viewers and total checkins. This means that from our data, the factor that most strongly affects total checkins is average concurrent viewers, which makes sense. The more people watch the stream, the more checkins there will be.

Account age by viewer age group

Here we wanted to determine the distribution of average account age with age group. 45+ year olds have the oldest accounts on average, because they have been alive for longer. However, 35-44 year olds have fewer accounts than 25-34 year olds and 18-24 year olds, though not by much. It might indicate a few factors, like 18-24 year olds being more into streaming culture, and 45+ year olds being the early adopters.
